

# What is relation extraction?

# borrowing from Daniel Jurafsky

# Extracting relations from text

- Company report: “International Business Machines Corporation (IBM or the company) was incorporated in the State of New York on June 16, 1911, as the Computing-Tabulating-Recording Co. (C-T-R)...”
- Extracted Complex Relation:

## Company-Founding

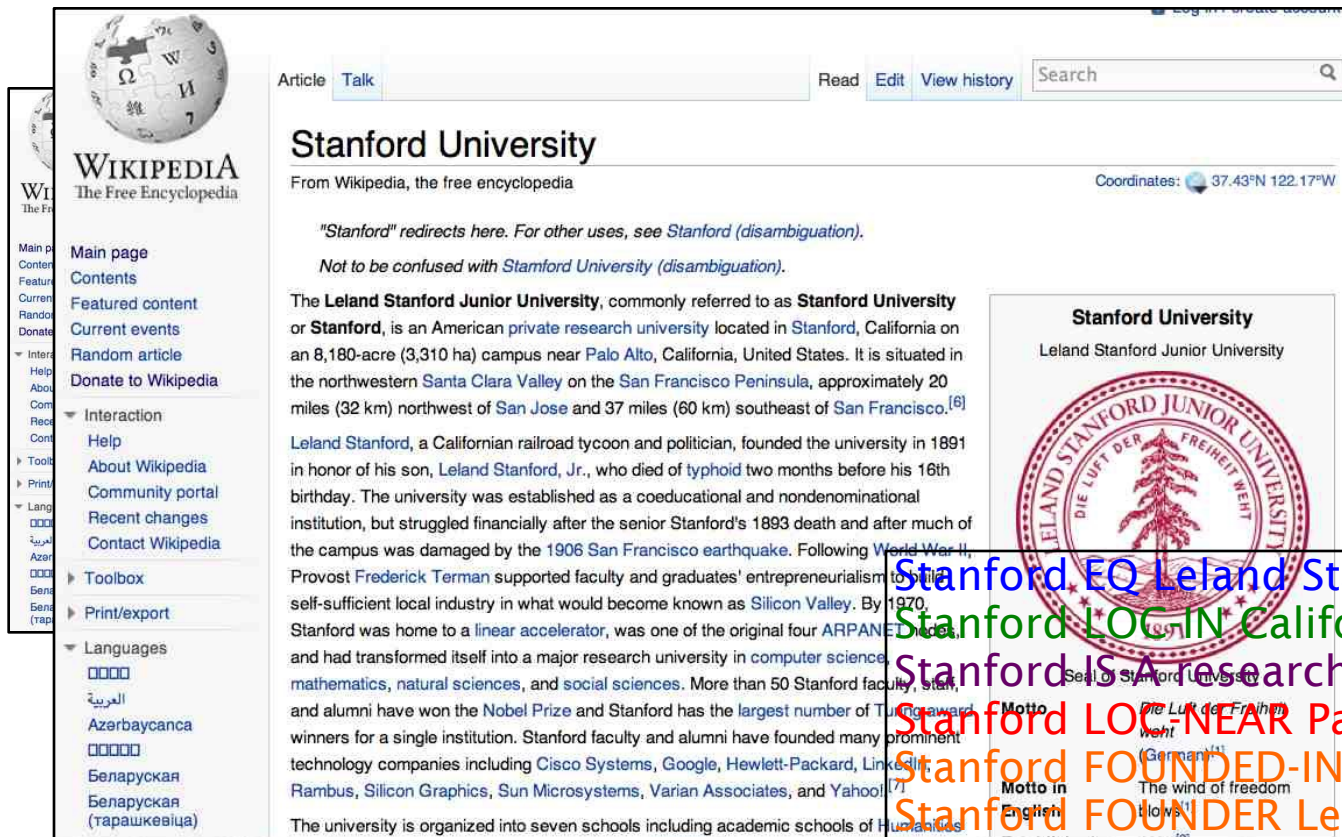

Company	IBM
Location	New York
Date	June 16, 1911
Original-Name	Computing-Tabulating-Recording Co.

- But we will focus on the simpler task of extracting relation **triples**

Founding-year(IBM,1911)

Founding-location(IBM,New York)

# Extracting Relation Triples from Text

The screenshot shows the Wikipedia article for Stanford University. The page includes a sidebar with navigation links, a main content area with text and a seal, and a search bar at the top. Overlaid on the page are several relation triples extracted from the text, color-coded to match the text they describe. A large black arrow points from the text 'Stanford...founded 1891' to the triple 'Stanford FOUNDED-IN 1891'.

## Stanford University

From Wikipedia, the free encyclopedia

Coordinates: 37°43′N 122°17′W﻿ / ﻿

*"Stanford" redirects here. For other uses, see [Stanford \(disambiguation\)](#).*

*Not to be confused with [Stanford University \(disambiguation\)](#).*

The **Leland Stanford Junior University**, commonly referred to as **Stanford University** or **Stanford**, is an American [private research university](#) located in [Stanford](#), California on an 8,180-acre (3,310 ha) campus near [Palo Alto](#), California, United States. It is situated in the northwestern [Santa Clara Valley](#) on the [San Francisco Peninsula](#), approximately 20 miles (32 km) northwest of [San Jose](#) and 37 miles (60 km) southeast of [San Francisco](#).<sup>[6]</sup>

[Leland Stanford](#), a Californian railroad tycoon and politician, founded the university in 1891 in honor of his son, [Leland Stanford, Jr.](#), who died of [typhoid](#) two months before his 16th birthday. The university was established as a coeducational and nondenominational institution, but struggled financially after the senior Stanford's 1893 death and after much of the campus was damaged by the 1906 [San Francisco earthquake](#). Following [World War II](#), Provost [Frederick Terman](#) supported faculty and graduates' entrepreneurialism to build a self-sufficient local industry in what would become known as [Silicon Valley](#). By 1970, Stanford was home to a [linear accelerator](#), was one of the original four [ARPANET](#) nodes, and had transformed itself into a major research university in [computer science](#), [mathematics](#), [natural sciences](#), and [social sciences](#). More than 50 Stanford faculty, staff, and alumni have won the [Nobel Prize](#) and Stanford has the [largest number of Turing Award winners](#) for a single institution. Stanford faculty and alumni have founded many prominent technology companies including [Cisco Systems](#), [Google](#), [Hewlett-Packard](#), [LinkedIn](#), [Rambus](#), [Silicon Graphics](#), [Sun Microsystems](#), [Varian Associates](#), and [Yahoo!](#)<sup>[7]</sup>

The university is organized into seven schools including academic schools of Humanities

iversity located in  
... near Palo Alto,  
Stanford...founded  
91

# Why Relation Extraction?

- Create new structured knowledge bases, useful for any app
- Augment current knowledge bases
  - Adding words to WordNet thesaurus, facts to FreeBase or DBPedia
- Support question answering
  - The granddaughter of which actor starred in the movie “E.T.”?  
(acted-in ?x “E.T.”)(is-a ?y actor)(granddaughter-of ?x ?y)
- But which relations should we extract?

# Automated Content Extraction (ACE)

17 relations from 2008 “Relation Extraction Task”

# Automated Content Extraction (ACE)

- Physical-Located      PER-GPE  
    He was in Tennessee
- Part-Whole-Subsidiary      ORG-ORG  
    XYZ, the parent company of ABC
- Person-Social-Family      PER-PER  
    John's wife Yoko
- Org-AFF-Founder      PER-ORG  
    Steve Jobs, co-founder of Apple...

•

# UMLS: Unified Medical Language System

- 134 entity types, 54 relations

Injury	disrupts	Physiological Function
Bodily Location	location-of	Biologic Function
Anatomical Structure	part-of	Organism
Pharmacologic Substance	causes	Pathological Function
Pharmacologic Substance	treats	Pathologic Function

# Extracting UMLS relations from a sentence

Doppler echocardiography can be used to  
diagnose left anterior descending artery  
stenosis in patients with type 2 diabetes

Echocardiography, Doppler **DIAGNOSES** Acquired stenosis

## Relation databases that draw from Wikipedia

- Resource Description Framework (RDF) triples  
subject predicate object  
Golden Gate Park [location](#) San Francisco  
dbpedia:Golden\_Gate\_Park [dbpedia-owl:location](#) dbpedia:San\_Francisco
- DBPedia: 1 billion RDF triples, 385 from English Wikipedia
- Frequent Freebase relations:

people/person/nationality,	location/location/contains
people/person/profession,	people/person/place-of-birth
biology/organism_higher_classification	film/film/genre

# Ontological relations

Examples from the WordNet Thesaurus

- IS-A (hypernym): subsumption between classes
  - Giraffe IS-A ruminant IS-A ungulate IS-A mammal IS-A vertebrate IS-A animal...
- Instance-of: relation between individual and class
  - San Francisco instance-of city

# How to build relation extractors

1. Hand-written patterns
2. Supervised machine learning
3. Semi-supervised and unsupervised
  - Bootstrapping (using seeds)
  - Distant supervision
  - Unsupervised learning from the web

# Relation Extraction

# What is relation extraction?

# Using patterns to extract relations

# Rules for extracting IS-A relation

Early intuition from **Hearst (1992)**

- “Agar is a substance prepared from a mixture of red algae, such as *Gelidium*, for laboratory or industrial use”
- What does *Gelidium* mean?
- How do you know?

# Rules for extracting IS-A relation

Early intuition from **Hearst (1992)**

- “Agar is a substance prepared from a mixture of **red algae, such as Gelidium,** for laboratory or industrial use”
- What does *Gelidium* mean?
- How do you know?

# Hearst's Patterns for extracting IS-A relations

(Hearst, 1992): Automatic Acquisition of Hyponyms

"Y such as X ((, X)\* (, and|or) X)"

"such Y as X"

"X or other Y"

"X and other Y"

"Y including X"

"Y, especially X"

# Hearst's Patterns for extracting IS-A relations

Hearst pattern	Example occurrences
X and other Y	...temples, treasuries, <b>and other</b> important civic buildings.
X or other Y	Bruises, wounds, broken bones <b>or other</b> injuries...
Y such as X	The bow lute, <b>such as</b> the Bambara ndang...
Such Y as X	... <b>such</b> authors <b>as</b> Herrick, Goldsmith, and Shakespeare.
Y including X	...common-law countries, <b>including</b> Canada and England...
Y , especially X	European countries, <b>especially</b> France, England, and Spain...

# Extracting Richer Relations Using Rules

- Intuition: relations often hold between specific entities
  - **located-in** (ORGANIZATION, LOCATION)
  - **founded** (PERSON, ORGANIZATION)
  - **cures** (DRUG, DISEASE)
- Start with Named Entity tags to help extract relation!

**Named Entities aren't quite enough.  
Which relations hold between 2 entities?**

**Drug**

Cure?  
Prevent?  
Cause?

**Disease**

# What relations hold between 2 entities?

PERSON

Founder?

Investor?

Member?

Employee?

President?

ORGANIZATION

# Extracting Richer Relations Using Rules and Named Entities

Who holds what office in what organization?

PERSON, POSITION of ORG

- George Marshall, Secretary of State of the United States

PERSON (named | appointed | chose | *etc.*) PERSON Prep? POSITION

- Truman appointed Marshall Secretary of State

PERSON [be]? (named | appointed | *etc.*) Prep? ORG POSITION

- George Marshall was named US Secretary of State

# Hand-built patterns for relations

- Plus:
  - Human patterns tend to be high-precision
  - Can be tailored to specific domains
- Minus
  - Human patterns are often low-recall
  - A lot of work to think of all possible patterns!
  - Don't want to have to do this for every relation!
  - We'd like better accuracy

# Using patterns to extract relations

# Supervised relation extraction

# Supervised machine learning for relations

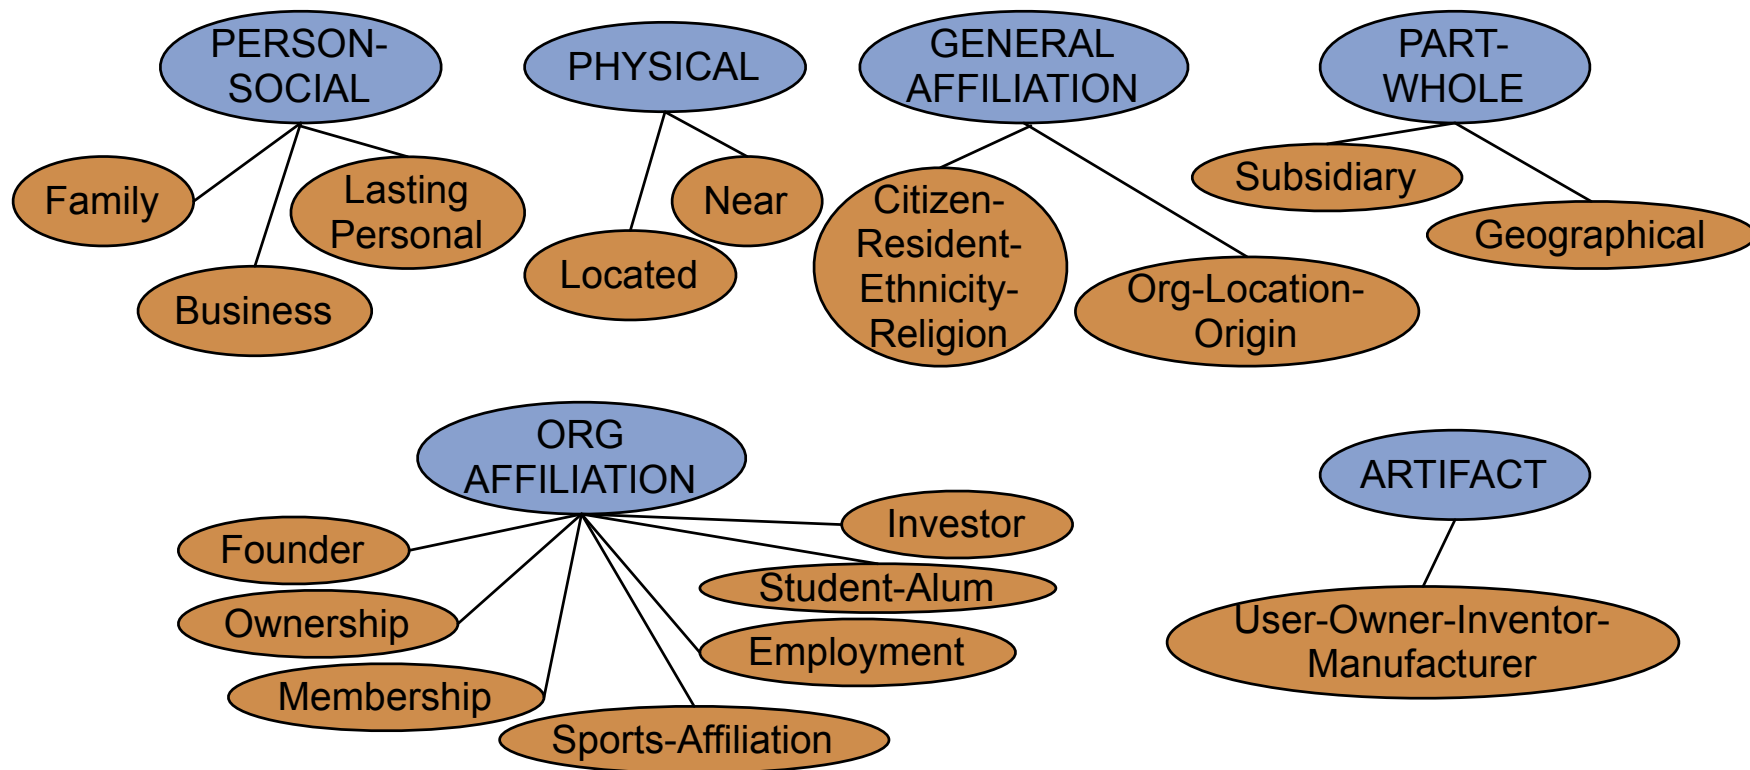

- Choose a set of relations we'd like to extract
- Choose a set of relevant named entities
- Find and label data
  - Choose a representative corpus
  - Label the named entities in the corpus
  - Hand-label the relations between these entities
  - Break into training, development, and test
- Train a classifier on the training set

# How to do classification in supervised relation extraction

1. Find all pairs of named entities (usually in same sentence)
  2. Decide if 2 entities are related
  3. If yes, classify the relation
- Why the extra step?
    - Faster classification training by eliminating most pairs
    - Can use distinct feature-sets appropriate for each task.

# Automated Content Extraction (ACE)

17 sub-relations of 6 relations from 2008 “Relation Extraction Task”

# Word Features for Relation Extraction

*American Airlines*, a unit of AMR, immediately matched the move, spokesman *Tim Wagner* said

Mention 1

Mention 2

- Headwords of M1 and M2, and combination

Airlines

Wagner

Airlines-Wagner

- Bag of words and bigrams in M1 and M2

{American, Airlines, Tim, Wagner, American Airlines, Tim Wagner}

- Words or bigrams in particular positions left and right of M1/M2

M2: -1 *spokesman*

M2: +1 *said*

- Bag of words or bigrams between the two entities

{a, AMR, of, immediately, matched, move, spokesman, the, unit}

## Named Entity Type and Mention Level Features for Relation Extraction

*American Airlines*, a unit of AMR, immediately matched the move, spokesman *Tim Wagner* said

Mention 1 Mention 2

- Named-entity types
  - M1: **ORG**
  - M2: **PERSON**
- Concatenation of the two named-entity types
  - **ORG-PERSON**
- Entity Level of M1 and M2 (NAME, NOMINAL, PRONOUN)
  - M1: **NAME** [it or he would be **PRONOUN**]
  - M2: **NAME** [the company would be **NOMINAL**]

# Parse Features for Relation Extraction

*American Airlines*, a unit of AMR, immediately matched the move, spokesman *Tim Wagner* said

Mention 1 Mention 2

- Base syntactic chunk sequence from one to the other

NP NP PP VP NP NP

- Constituent path through the tree from one to the other

NP ↑ NP ↑ S ↑ S ↓ NP

- Dependency path

Airlines matched Wagner said

*American Airlines*, a unit of AMR, immediately matched the move, spokesman *Tim Wagner* said.

### Entity-based features

Entity <sub>1</sub> type	ORG
Entity <sub>1</sub> head	<i>airlines</i>
Entity <sub>2</sub> type	PERS
Entity <sub>2</sub> head	<i>Wagner</i>
Concatenated types	ORGPERS

### Word-based features

Between-entity bag of words	{ <i>a, unit, of, AMR, Inc., immediately, matched, the, move, spokesman</i> }
Word(s) before Entity <sub>1</sub>	NONE
Word(s) after Entity <sub>2</sub>	<i>said</i>

### Syntactic features

Constituent path	$NP \uparrow NP \uparrow S \uparrow S \downarrow NP$
Base syntactic chunk path	$NP \rightarrow NP \rightarrow PP \rightarrow NP \rightarrow VP \rightarrow NP \rightarrow NP$
Typed-dependency path	$Airlines \leftarrow_{subj} matched \leftarrow_{comp} said \rightarrow_{subj} Wagner$

# Classifiers for supervised methods

- Now you can use any classifier you like
  - MaxEnt
  - Naïve Bayes
  - SVM
  - ...
- Train it on the training set, tune on the dev set, test on the test set

# Evaluation of Supervised Relation Extraction

- Compute P/R/ $F_1$  for each relation

$$P = \frac{\text{\# of correctly extracted relations}}{\text{Total \# of extracted relations}}$$

$$R = \frac{\text{\# of correctly extracted relations}}{\text{Total \# of gold relations}}$$

$$F_1 = \frac{2PR}{P + R}$$

## Summary: Supervised Relation Extraction

- + Can get high accuracies with enough hand-labeled training data, if test similar enough to training
- Labeling a large training set is expensive
- Supervised models are brittle, don't generalize well to different genres

# Supervised relation extraction

# Semi-supervised relation extraction

## Seed-based or bootstrapping approaches to relation extraction

- No training set? Maybe you have:
  - A few seed tuples or
  - A few high-precision patterns
- Can you use those seeds to do something useful?
  - Bootstrapping: use the seeds to directly learn to populate a relation

# Relation Bootstrapping (Hearst 1992)

- Gather a set of seed pairs that have relation R
- Iterate:
  1. Find sentences with these pairs
  2. Look at the context between or around the pair and generalize the context to create patterns
  3. Use the patterns for grep for more pairs

# Bootstrapping

- <Mark Twain, Elmira> **Seed tuple**
  - Grep (google) for the environments of the seed tuple
    - “Mark Twain is buried in Elmira, NY.”
      - X is buried in Y**
    - “The grave of Mark Twain is in Elmira”
      - The grave of X is in Y**
    - “Elmira is Mark Twain’s final resting place”
      - Y is X’s final resting place.**
- Use those patterns to grep for new tuples
- Iterate

# Dipre: Extract <author,book> pairs

Brin, Sergei. 1998. Extracting Patterns and Relations from the World Wide Web.

- Start with 5 seeds:

Author	Book
Isaac Asimov	The Robots of Dawn
David Brin	Startide Rising
James Gleick	Chaos: Making a New Science
Charles Dickens	Great Expectations
William Shakespeare	The Comedy of Errors

- Find Instances:

The Comedy of Errors, by William Shakespeare, was

The Comedy of Errors, by William Shakespeare, is

The Comedy of Errors, one of William Shakespeare's earliest attempts

The Comedy of Errors, one of William Shakespeare's most

- Extract patterns (group by middle, take longest common prefix/suffix)

?x , by ?y ,                      ?x , one of ?y 's

- Now iterate, finding new seeds that match the pattern

# Snowball

E. Agichtein and L. Gravano 2000. Snowball: Extracting Relations from Large Plain-Text Collections. ICDL

- Similar iterative algorithm

Organization	Location of Headquarters
Microsoft	Redmond
Exxon	Irving
IBM	Armonk

- Group instances w/similar prefix, middle, suffix, extract patterns
  - But require that X and Y be named entities
  - And compute a confidence for each pattern

.69    **ORGANIZATION**    {'s, in, headquarters}    **LOCATION**

.75    **LOCATION**    {in, based}    **ORGANIZATION**

# Distant Supervision

Snow, Jurafsky, Ng. 2005. Learning syntactic patterns for automatic hypernym discovery. NIPS 17

Fei Wu and Daniel S. Weld. 2007. Autonomously Semantifying Wikipeida. CIKM 2007

Mintz, Bills, Snow, Jurafsky. 2009. Distant supervision for relation extraction without labeled data. ACL09

- Combine bootstrapping with supervised learning
  - Instead of 5 seeds,
    - Use a large database to get huge # of seed examples
  - Create lots of features from all these examples
  - Combine in a supervised classifier

# Distant supervision paradigm

- Like supervised classification:
  - Uses a classifier with lots of features
  - Supervised by detailed hand-created knowledge
  - Doesn't require iteratively expanding patterns
- Like unsupervised classification:
  - Uses very large amounts of unlabeled data
  - Not sensitive to genre issues in training corpus

## Distantly supervised learning of relation extraction patterns

- 1 For each relation
- 2 For each tuple in big database
- 3 Find sentences in large corpus with both entities
- 4 Extract frequent features (parse, words, etc)
- 5 Train supervised classifier using thousands of patterns

Born-In

<Edwin Hubble, Marshfield>  
<Albert Einstein, Ulm>

Hubble was born in Marshfield  
Einstein, born (1879), Ulm  
Hubble's birthplace in Marshfield

PER was born in LOC  
PER, born (XXXX), LOC  
PER's birthplace in LOC

$P(\text{born-in} \mid f_1, f_2, f_3, \dots, f_{70000})$

# Unsupervised relation extraction

M. Banko, M. Cararella, S. Soderland, M. Broadhead, and O. Etzioni.  
2007. Open information extraction from the web. IJCAI

- Open Information Extraction:
  - extract relations from the web with no training data, no list of relations
- 1. Use parsed data to train a “trustworthy tuple” classifier
- 2. Single-pass extract all relations between NPs, keep if trustworthy
- 3. Assessor ranks relations based on text redundancy
  - (FCI, specializes in, software development)
  - (Tesla, invented, coil transformer)

# Evaluation of Semi-supervised and Unsupervised Relation Extraction

- Since it extracts totally new relations from the web
  - There is no gold set of correct instances of relations!
    - Can't compute precision (don't know which ones are correct)
    - Can't compute recall (don't know which ones were missed)
- Instead, we can approximate precision (only)
  - Draw a random sample of relations from output, check precision manually
$$\hat{p} = \frac{\text{\# of correctly extracted relations in the sample}}{\text{Total \# of extracted relations in the sample}}$$
- Can also compute precision at different levels of recall.
  - Precision for top 1000 new relations, top 10,000 new relations, top 100,000
  - In each case taking a random sample of that set
- 47 But no way to evaluate recall

# Semi-supervised relation extraction
